

ACCOUNTING PRACTICE MANAGEMENT

Tempolia for accounting firms

Link engagements, time, quantities, obligations, budgets, invoicing, payments and analyses in the same management environment.

Tempolia is designed for firms that want to manage work delivery without separating recorded time, client obligations, fees, invoicing and payments. The client record remains the reference point for budgets, actual work, documents and financial flows.

- Entry of past or planned times, expenses and social quantities.
- Word engagement letters, fee budgets and tax or social obligations.
- Fixed-price invoices, subscription, deposit, quantity or real time, then direct debits and reminders.

Since 1988

SOFTWARE EXPERTISE

10,300 users

REAL-WORLD USE

235,000 client records

MANAGED RECORDS

40 integrations

ECOSYSTEM

Manage the tax cycle

Plan recurring obligations, distribute the load and identify tensions before deadlines.

Secure invoicing

Prepare fees from budgets, quantities, time and expenses, with a review before issue.

Manage engagement recovery

Compare production, budgets, invoicing and payments by client, financial year, engagement or staff member.

A complete management cycle

From data entry to management insight

1

Configure

Define the rules and permissions.

2

Record

Collect reliable data.

3

Prepare

Review before approval.

4

Invoice

Deliver without duplicate data entry.

5

Analyse

Measure and improve.

WHAT THIS SOLUTION COVERS

- Tax period, obligations and budgets managed in the same chain.
- Review invoices before issue and monitor engagement recovery.
- Accounting exports, direct debits, reminders, API, SSO and BI.

Over 35 years in France

Tempolia supports professional-services firms with their internal management.

Supported implementation

Configuration, data migration, training and support tailored to the agreed scope.

Interoperability

Accounting integrations, API, SSO, BI, DMS and electronic invoicing.

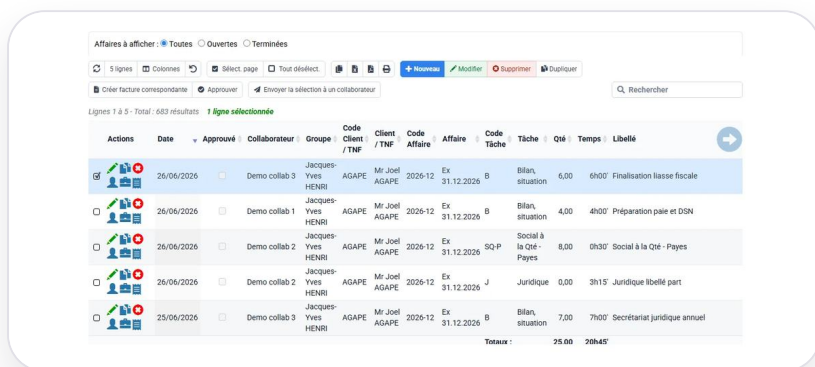

Built for professional services

Professional-services firms manage time, budgets, invoices and payments.

WORK DELIVERY AND OBLIGATIONS

Production data usable by the firm and by management.

Each entry is linked to a client and engagement. Permissions and valuation rules determine what each user can enter, view, edit and analyse.

Entering times and permissions

staff members enter their times directly, import batches or use specialised screens. permissions control access by staff member, group, sector and level.

Quantities and social engagement

The numbers of bulletins or acts can be monitored, budgeted and compared to previous periods to manage the load and variances.

Fees, disbursements and parts

staff member costs are entered from timesheets or dedicated screens, with supporting documents and re-invoicing rules.

Multi-axis analyses

The tables cross-reference client, staff member, task, period, company, group and sector to inform decisions.

Bonds and Events

Recurring deadlines structure obligation tracking and create a usable history for each client record.

Engagement letters and configurable records

Word templates include client fields, specifications, budgets and obligations to speed up preparation.

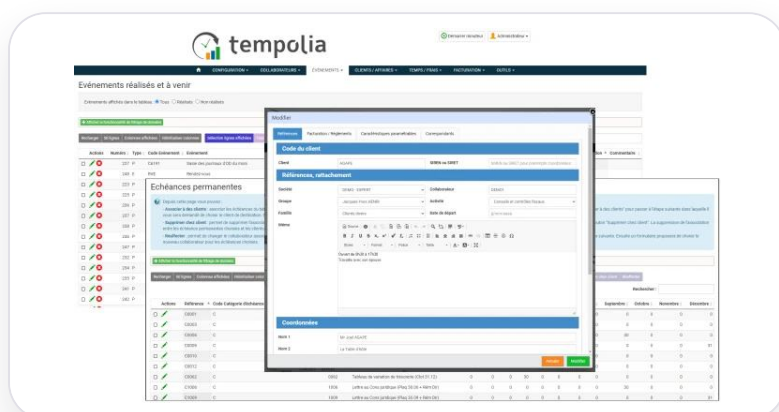

- Entry can be done from the Web on PC, tablet or telephone, or by Excel import; permissions can authorize consultation of times without displaying financial values.
- The analyses compare invoices issued, value of time, quantities and costs, with monitoring by financial year, calendar period, staff member, group or company.
- Standard sales prices remain adaptable per client, which reconciles common scales, special conditions and monitoring of social quantities.
- client, correspondent and client records also feed lists, exports, editions, letters and selective communications.

Work delivery becomes a basis for management insight, not just administrative data capture.

DECISION AND DEPLOYMENT

A practice-management foundation connected to the firm's ecosystem.

The objective is not to replace all of the firm's software, but to make the internal management chain coherent and transmit the permission data to specialised tools.

Accounting and electronic invoicing

Invoices, payments and expenses can be exported to many accounting software programs in the expected format.

API, SSO and BI

The web API, unified authentication and reporting connectors allow Tempolia to be integrated into an existing information system.

Support and continuity

Tempolia has been evolving with firms since 1988. The data remains accessible over time and the teams are supported in its uses.

Points to frame before decision

Data-entry processes, approval workflows, templates, permissions, exports, data migration and management objectives must be defined from the outset.

- Invoices, payments and expenses can be exported to numerous accounting software in the expected format; Factur-X and electronic invoicing flows depend on the scope chosen.
- Implementation must define entities, permissions, the engagement catalogue, tasks, quantities, rates, obligations, engagement letters, invoicing and historical data migration.
- The API, imports/exports, BI, SSO and connectors allow Tempolia to be integrated into accounting, DMS, HRIS and the firm's repositories.
- Tempolia AI and the MCP server can search records, identify invoices for review and produce analysis within each user's permissions.
